Statistical Peers for Benchmarking

Which APS schools are most alike in terms of student characteristics?

The Statistical Peers for Benchmarking tool was created in response to principals' requests for a data-driven strategy to identify groups of similar schools. The tool addressed the question: "Which APS schools are most alike in terms of student characteristics?" Peer groups were formed based on schools' percentages of FRPM, ELL, Underperforming Minorities¹, and Stability² using the statistical method cluster analysis. The method clusters similar schools into groups distinct from one another. When using the Statistical Peers tool, consider each group an intact set of comparison schools.

The Statistical Peers for Benchmarking tool was designed for array of uses from comparing schools on measures of student achievement to creating work groups for principals' in-services. A primary goal for the tool is to foster collaboration. Comparing schools within one statistical peer group is informative, yet there probably will be situations for some schools to compare themselves to schools in other peer groups. For example, while MacArthur and John Baker are in different statistical peer groups, both are Special Ed Intensive Support Program sites, thus occasionally they may choose to make comparisons with one another.

This report contains three sections. First, the Statistical Peers for Benchmarking tool presents APS schools in 10 groups of statistical peers, five elementary, three middle, two high school³.

There are 3 sections presented:

- Statistical Peers for Benchmarking
- Data used to form statistical peer groups, and recent SBA results
- Graphic displays of 2004-05 SBA results

The second section displays data used in forming the statistical peer groups, recent AYP status, and math and reading percent proficient from the 2005 standards based assessments. Graphs in the third section display achieved percent proficient and an predicted achievement range for each school. Predicted achievement ranges are 95% confidence intervals from multiple regression analysis.

The graphs show only one moment in time (status), so growth from year to year is not considered⁴. In other words, while a school may appear to have performed well or poorly, remarkable loss or gain in performance may be evident when a series of its achievement measures are examined. Predicted achievement ranges provide another way to consider SBA results and represent an improvement over NCLB target methods.

¹ Hispanic, Native American, African American

² Percentage of students enrolled at same school on days 40 and 180 of an academic year

³ Alternative schools not included because school focus uniquely impacts student populations

⁴ Future versions may incorporate a growth method

Using Statistical Peers for Benchmarking

Consider each statistical peers group an distinct set of comparison schools when using the Statistical Peers tool. There probably will be situations for some schools also to compare themselves to schools in other peer groups.

Consider each group a distinct set of comparison schools

Schools with select special programs are identified.

*Special Ed. Intensive Support Program site

Comparison of Achieved Percent Proficient and Predicted Achievement Range

Solid bars reflect schools' percent proficient achieved. Hairlines show an predicted achievement range (95% confidence interval). Graphs show only one moment in time (status) and growth is not considered in this comparison. Predicted achievement ranges provide another way to consider SBA results and represent an improvement over NCLB target methods.
